SPECIFICATIONS

	Nominal	Limit
RECEIVER		
SENSITIVITY		
10 dB (S + N)/N	0.5 μ V	1.0 μ V
20 dB (S + N)/N	1.5 μ V	2.0 μ V
SELECTIVITY		
at \pm 10 kHz	60 dB	50 dB
at -6 dB	6 kHz	3.5–8 kHz
SPURIOUS SIGNAL REJECTION	-55 dB	-50 dB
SQUELCH RANGE		
minimum	0.25 μ V	0.5 μ V
maximum	1000 μ V	100–10000 μ V
IF FREQUENCY	11.275 MHz	
	455 kHz	
AUDIO POWER OUTPUT (in PA use, 10% distortion)	4.0 W	3.5 W
AUDIO FREQUENCY RESPONSE (compared to 1 kHz)	400 Hz: -6 dB	400 Hz: -6 \pm 5 dB
	2 kHz: -8 dB	2 kHz: -8 \pm 5 dB
IMAGE RESPONSE	28 MHz: 46 dB	28 MHz: 40 dB
	other: 51 dB	other: 45 dB
TRANSMITTER		
DC INPUT POWER	12.0 V x 390 mA	
RF OUTPUT POWER	4.0 W (AC > 3.3 W)	3.5 W (AC 3 W)
SPURIOUS RADIATION	55 dB	50 dB
MODULATION	+100 -90%	\pm 85%
RF FREQUENCY STABILITY	\pm 0.002%	\pm 0.005%
GENERAL POWER REQUIREMENT	12–14 V DC Positive or Negative Ground	
MAX. POWER CONSUMPTION	25 watts	
MICROPHONE	Dynamic	

NOTE: Nominal Specs represent the design specs; all units should be able to approximate these—some will exceed and some may drop slightly below these specs. Limit Specs represent the absolute worst condition which still might be considered acceptable; in no case should a unit perform to less than within any Limit Spec.

DISASSEMBLY

1. Removal of case:

After removing mounting brackets, remove the four screws holding case as shown in Figure 2.

2. Removal of compartment lid:

Remove the four screws holding compartment lid shown in Figure 3.

Figure 2

Figure 3

ALIGNMENT OF RECEIVER SECTION

EQUIPMENT REQUIRED:

Signal generator 455 kHz and 27 MHz
 Modulated 1000Hz, 30% AM
 Output Impedance 50 ohms
 VTVM
 DC power supply 13.8 Volts, 1.5A.
 Oscilloscope, Frequency Meter or Counter

NOTES:

Allow test equipment and set at least 15 minutes to warm up before starting the alignment.
 Output Level: Keep signal generator as low as possible to prevent AGC overload.
 Output level of test set should be kept under 2 volts.

Step	Connect Signal Source to—	Connect Output Indicator to—	Set Signal to—	Adjust	Adjust for—	Step
1	Set Channel Selector to Ch. #13 and DELTA TUNE to center.					1
2	Turn VR7 (Volume) fully clockwise.					2
3	Turn VR3 (Squelch) fully counterclockwise.					3
4		Oscilloscope to L904 Secondary		L901	Maximum Amplitude	4
5				L902		5
6				L903		6
7				L904		7
8	Sig. Gen. Connected to ANT. terminal	V.T.V.M. connected across ext. speaker jack 8 ohm resistive load	27.115 MHz (Modulated) Signal input should be under 50 μ V	L101	Maximum Output	8
9				L102		9
10				T301		10
11				T302		11
12				T303		12
13				T304		13
14				T305		14
15				T306		15
16	Repeat steps 8 through 15 as necessary to obtain maximum sensitivity.					16
17	Signal Gen. connected to antenna jack	V.T.V.M. connected across ext. speaker jack	27.115 MHz Signal input should be 0.25 μ V.	VR1	Adjust VR1 for 2.0 volts V.T.V.M. indication.	17
18	Same as 17	Same as 17	27.115 MHz Signal input should be 1000 μ V.	VR2	Adjust for squelch open with 1000 μ V input.	18
19	Signal Gen. connect to antenna jack (100 μ V)	8 ohm resistive load	27.115 MHz	VR4	Adjust for zero reading on the S meter.	19
20	Signal Gen. connect to antenna jack (100 μ V)	8 ohm resistive load	27.115 MHz	VR6	Adjust for S9 reading on the S meter.	20

ALIGNMENT OF TRANSMITTER SECTION

EQUIPMENT REQUIRED:

This transceiver meets all requirements of F.C.C. Rules and Regulations, Part 95. Only those persons properly licensed by the F.C.C. are permitted to repair or adjust any malfunctioning unit found to be transmitting illegally (refer to F.C.C. Rules and Regulations, Part 95, Sub part D, Section 95.)

NOTES:

Allow test equipment and set at least 15 minutes to warm up before starting the alignment.
An RF Output meter or 50 ohms non-inductive dummy load must be connected to the antenna jack.

Step	Connect Signal Source to—	Connect Output Indicator to—	Adjust	Adjust for—	Step
1	Set Channel Selector to Ch. # 13				1
2		Watt Meter across Antenna Jack or Oscilloscope may be used as the Output Indicator.	L905	Key Transmitter and adjust for Maximum Output.	2
3			L906		3
4			L907		4
5			L908		5
6			L910		6
7			L912		7
8			L913		8
9	Repeat steps 2 through 8 as necessary to obtain maximum output.				9
10	Audio Generator to microphone Jack	Oscilloscope to antenna jack and observe 80 to 100% modulation signal also watt meter across antenna jack	L910	Maximum Output	10
11	Adjust audio Signal level to obtain 80-100% modulation level.		L912		11
12			L913		12
13	Repeat steps 10 through 12 to obtain 3.5-4 watts output on all Channels.				13
14	Check R.F. deviation with Digital Frequency Counter on all Channels.				14
15	Audio Generator to microphone jack 100% modulation	Same as above	VR8	No distortion of modulation waveform at 100% modulation with 15mV input at mic jack (See Fig. 4)	15
16	No Modulation	Same as above	VR5	3.5-4.0 on the R.F. meter (depending on output obtained in step 13)	16
17	No Modulation	Frequency Monitor/ Wavemeter/Spectrum Analyzer or other type monitoring instrument across Antenna jack	L914	Minimum 54 MHz (and other spurious radiation frequencies) output	17

Transmitter

TEST EQUIPMENT SETUP DIAGRAM

ANTENNA SYSTEM

An antenna system can be considered to include the antenna proper, the feed line, and any coupling devices used for transferring power from the transmitter to the line and from the line to the antenna. Some simple systems may omit the transmission line or one or both of the coupling devices.

Selecting an Antenna

For mobile operation at 27 MHz, the vertical whip antenna is almost universally used. Since longer whips present mechanical difficulties, the length is usually limited to a dimension that will resonate as a quarter-wave antenna in the CB band; the car body serves as the ground connection. This antenna length is approximately 8.5 feet. With the whip length adjusted to resonance in the CB band, the impedance at the feed point, X, Fig. 5, will appear as a pure resistance at the resonant frequency.

Mobile Antenna

Minimizing Losses

There is little that can be done about the nature of the coil. However, poor electrical contact between large surfaces of the car body, and especially between the point where the feed line is grounded and the rest of the body, can add materially to the ground-loss resistance. For example, the feed line, which should be grounded as close to the base of the antenna as possible, might be connected to the bumper, while the bumper may have poor contact with the rest of the body because of rust or paint.

Feeding the Antenna

It is usually found most convenient to feed the whip antenna with coax line. Unless very low-Q loading coils are used the feed-point impedance will always be appreciably lower than 52 ohms—the characteristic impedance of the commonly used coax line, RG-8/U or RG-58/U. One method of obtaining a match is shown in Fig. 6. For detailed information on precise loading and matching of Antennas and Transmission line systems, refer to the latest-edition of the **ARRL Handbook**.

TROUBLE SHOOTING

RECEIVER SECTION

- (1) Pilot lamp does not light when power switch is turned on.
 - a. Make sure that power supply is connected with correct polarity.
 - b. Check power supply circuit for shorts.
 - c. Check power supply circuit for loose connections.
 - d. Check Diode D703.
 - e. Check fuse.
- (2) No sound (noise) from the speaker
 - a. Check with an external speaker.
 - b. See if speaker leads are broken. Also, check other leads.
 - c. Make sure that microphone switching is operating correctly.
 - d. Check to be sure the audio circuit is functioning. Check the terminal voltage of transistors Q701, Q703, Q704 and Q705.
(If you touch the terminals of volume control (VR7) with your finger, you should hear noise. Thus, you know the audio circuit is functioning.)
 - e. Make sure that Squelch circuit is operating normally.
 - f. Check for presence of 23MHz, 14MHz and 11.730MHz oscillation. If so, check that all oscillations are strong enough.
 - g. Check the connections of Channel Selector switch and Delta Tune switch.
- (3) RF meter ("S" meter) operation is abnormal.
 - a. See if the emitter voltage of Q102 corresponds to incoming signal.
 - b. Check connections of R530 and R527.
 - c. Check C533 for a short.

TRANSMITTER SECTION

- (1) No output
 - a. Insure microphone plug is inserted correctly.
 - b. Try replacing the microphone.
 - c. Check for the presence of 23MHz, 14MHz and 11MHz oscillation. If so, are they strong enough ?
 - d. Make sure PA switch is not pushed to PA position.
 - e. Check that each transistor is operating normally.
- (2) No Modulation (Modulation lamp does not light)
 - a. Make sure the direct current resistance of the third coil of modulation transformer (T702) is from 1 to 1.2 ohm.
 - b. Try replacing the microphone.
 - c. Check the terminal voltages of Q702.
 - d. Check values of C708 and C528.
 - e. Check values of C709, C710 and C707.

NO RECEIVING AND NO TRANSMITTING

- (1) Check microphone circuit.
- (2) Check for presence of 23MHz and 14MHz oscillation.
- (3) Check circuit voltages of Q901 and Q904.
- (4) Check voltages of Q902.
- (5) Check wire leads of coil L902, L903 and L904.
